Optimization of machine learning algorithms

One could want to optimize an algorithm in order to be :

- Time efficient
- Cost efficient

Optimizing a machine learning algorithm consists of optimizing a **black box** problem. One has multiple ways to optimize it :

- By simply **increasing the computational power**, we will then improve the execution time at the expense of the costs
- Optimizing the algorithm **hyperparameters**

IntroductionOptimization techniquesEnvironmentExperimentsConclusion••••••••••••••••••••••••

Hyperparameters of a ML algorithm

A **hyperparameter** is a parameter that is set before the beginning of the learning processes and impacts the effectiveness of a model training.

This can be :

- The learning rate
- Properties of the neural network (number of layers and neurons)
- Batch size
- Number of epochs

. . .

•

Supervision method

We chose to use **supervised learning** in order to perform our hyperparameters optimization.

Supervised learning is defined by :

- A labeled dataset. All the inputs and outputs of the dataset is correctly labeled
- Thanks to this, the model can measure precisely :
 - His accuracy over time
 - His loss over time

Like this, it is easier to classify accurately how hyperparameters sets perform

A harder but more flexible method would have been **unsupervised learning**

Optimization of a hyperparameter

This can be achieved by using multiple techniques such as :

- Grid search
- Random search
- Bayesian optimization

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	••••		•••••	$\bullet \bullet \bullet \bullet$

Grid search

This algorithm will generate **all** the neural networks possible based on **all** the hyperparameters possible combinations and train all of them to keep the best results

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	$\bullet \bullet \bullet \bullet \bullet$		•••••	$\bullet \bullet \bullet \bullet$

Random grid search

This algorithm will generate **x out of n** neural networks possible based on **x out of n** of the hyperparameters possible combinations and train all of them to keep the best results

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	$\bullet \bullet \bullet \bullet \bullet$	$\bullet \bullet \bullet \bullet$		$\bullet \bullet \bullet \bullet$

Introduction to Bayesian Optimization

Like classical optimization : Min f(x), $x \in X$

Bayesian optimization constructs a probabilistic model for f(x) and then exploits this model to make decisions about where in X to next evaluate the function, while integrating out uncertainty.

Use all information of the function.

The 2 choices of Bayesian Optimization :

- Select a prior over functions that will express assumptions about the function being optimized (Gaussian)
- · Choose an acquisition function that will determine the next point to evaluate.

$\bullet \bullet \bullet \bullet$	$\bullet \bullet \bullet \bullet \bullet$	$\bullet \bullet \bullet \bullet$	••••	$\bullet \bullet \bullet \bullet$

Bayesian Optimization Gaussian Process

Gaussian Processes (GP) :

<u>**Property</u>** : Assume that the GP is a function define by $f : X \to R$. Any finite set of N points $\{x_n \in X\}_{n=1}^N$ induces a multivariate Gaussian distribution on R^N . (Gaussian generalized to N dimensional space).</u>

$$x \in X$$
: $x_{next} = argmax_x a(x), a(x; \{x_n, y_n\}, \theta) : X \rightarrow R^+$

Mean and Variance : $\mu(x; \{x_n, y_n\}, \theta), \sigma^2(x; \{x_n, y_n\}, \theta)$

 $x_{best} = argmin_{x_n} f(x_n)$

The cumulative distribution function : $\Phi(x)$

Bayesian Optimization method used in the project

- There are different types of improvements for the Bayesian steps :
- One intuitive strategy is to maximize the probability of improving over the best current value. Under the GP this can be computed analytically as :

$$a_{PI}(x; \{x_n, y_n\}, \theta) = \Phi(\gamma(x)), \ \gamma(x) = \frac{f(x_{best}) - \mu(x; \{x_n, y_n\}, \theta)}{\sigma(x; \{x_n, y_n\}, \theta)}$$

 Alternatively, one could choose to maximize the expected improvement (EI) over the current best value. This also has closed form under the Gaussian process:

$$a_{EI}(x ; \{x_n, y_n\}, \theta) = \sigma(x ; \{x_n, y_n\}, \theta)(\gamma(x) \Phi(\gamma(x)) + N(\gamma(x) ; 0, 1))$$

Data Processing

Data Set for Image Classification:

MNIST Handwritten Data

https://www.researchgate.net/figure/Exampleimages-from-the-MNIST-dataset_fig1_306056875 Data Processing:

- Splitting into training and testing data
- Flattening Data
- Rescaling pixel values

Neural Network Construction

Hidden Hidden Hidden Input layer 1 layer 2 layer 3 layer Output layer 784 Variable Number of 10 Neurons Softmax Neurons Neulons Relu Adtivation Activation POSTPEH

Variable inputs of the neural network construction for hyperparameter testing:

- Learning rate
- Momentum
- Number of neurons per Layer

Constant hyperparameters:

- Number of layers
- Batch Size
- Epochs

Experiments

We did multiple experiments in order to see the impact of hyperparameters on neural networks results.

- We tried to optimize hyperparameters using 3 techniques :
 - Grid search
 - Random grid search
 - Bayesian optimization

And compare how the new parameterized neural network performed with these hyperparameters.

 Separately, we also tried to see the impact of the number of epochs on the final performance

Bayesian optimization

Grid Setup:

- Search space : random combinations of :
 - Learning rate: 10⁻ⁿ with integer n in [-4,0]
 - Momentum : [0, 1] with a stepsize of 0.1
 - Number of hidden layers : 3
 - Number of nodes per layer : [x, y, z, 10] with x, y, z in {16,32,64}

Continuous Setup:

- Search space : random combinations of :
 - Learning rate: 10⁻ⁿ with n from uniform distribution [-4, 0]
 - Momentum : from uniform distribution [0, 1]
 - Number of hidden layers : 3
 - Number of nodes per layer : [x, y, z, 10] with x, y, z in {16,32,64}

For each setup:

- Probability of Improvement Acquisition Function
- Expected Improvement Acquisition Function

Introduction	Optimization techniques	Environment	Experiments	Conclusion

Grid

Visualizing Bayesian Learning

Setup:

- Search space: Continuous hyperparameter search space
- Acquisition function: Expected improvement acquisition function
- Number of neurons per layer: fixed to [32,64,16,10]
- Optimized: Learning rate and momentum

Result

- Heat map plot of Bayesian predicted accuracy of setting of learning rate and momentum
- Visualize predictions after a different number of iteration of the Bayesian algorithmc

Impact of epochs

Setup:

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	••••	$\bullet \bullet \bullet \bullet$	•••••	$\bullet \bullet \bullet \bullet$

Observation:

 Neural network accuracy varied from ~0.1 to ~0.97 after 4 epochs based on various hyperparameter settings

Potential Reasoning:

• Hyperparameter have significant effects on how the SGD optimization algorithm functions and whether it converges to an optimal point

Conclusion:

• Finding good hyperparameter settings is important for efficient training and good accuracy of a neural network

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	••••	$\bullet \bullet \bullet \bullet$	•••••	$\bullet \bullet \bullet \bullet$

Observation:

 Grid search took takes massive number of evaluations to complete while random search and Bayesian optimization will find a good set of hyperparameter in very few evaluation

Potential Reasoning:

- There are many points in the search space that are good sets of hyperparameter that even by random sampling you are likely to discover a good set of hyperparameter in very little time
- Bayesian optimization provide allows sampling that is more likely to be a good set

Conclusion:

• It is best to use either random search or Bayesian optimization for hyperparameter tuning

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	••••	$\bullet \bullet \bullet \bullet$	•••••	$\bullet \bullet \bullet \bullet$

Observation:

Heat plots show that accuracy predictions vary greatly across different
learning rates while moment has less effect on accuracy predictions

Potential Reasoning:

- Learning rate can affect significantly how fast a model converges or whether is converges at all
- Learning rate can determine whether a model gets stuck in a local minimum
- Momentum has less effect on convergence behavior

Conclusion:

• It might be important to optimize learning rate than momentum

Introduction	Optimization techniques	Environment	Experiments	Conclusion
$\bullet \bullet \bullet \bullet$	••••	$\bullet \bullet \bullet \bullet$	•••••	$\bullet \bullet \bullet \bullet$

Observation:

Bayesian optimization results were not significantly better than random search results

Potential Reasoning:

- The search space was small and many candidates in the search space were equally good
- Convergence to optimal hyperparameters took very few iteration not allowing Bayesian optimization to develop a good model

Conclusion:

Bayesian optimization may be better applied to more complex hyperparameter setting with larger search spaces

Introduction	Bayesian functioning	Improved Bayesian	Experiments	Conclusion
$\bullet \bullet \bullet$	••••	••••	•••••	•

- Finding a good set of hyperparameter is an important part of creating an efficient functioning neural network
- Hyperparameter setting have significant effects on convergence behavior of a neural network
- Some hyperparameters have more effect on convergence rate than others
- Both random search and Bayesian optimization can both be useful methods to tune hyperparameters which is a better fit may be dependent on the search space complexity
